Quantitative data scientist with a PhD in applied statistics and 5 years building analytical frameworks, defining impact metrics, and translating complex datasets into decisions for cross-functional stakeholders. Core stack is Python and SQL; experienced in statistical evaluation, hypothesis testing, A/B testing methodology, and designing measurement frameworks in fast-moving, iterative product environments.

## Core Competencies

---

- **Data Analytics & Python:** pandas, NumPy, scikit-learn, XGBoost, LightGBM, matplotlib; large dataset analysis; statistical modelling and hypothesis testing to measure outcome improvements
- **Impact Metrics & Experimentation:** Defined and tracked success metrics across a 4-year programme; designed controlled comparison experiments and interpreted statistical results to measure outcome improvements; probabilistic evaluation (RMSE, Brier score, reliability analysis); systematic model calibration and refinement
- **SQL & Data Modelling:** SQL for analytical queries, data extraction, and data modelling; automated data ingestion and processing pipelines (ECMWF API, NetCDF/GRIB, xarray) for operational datasets
- **Stakeholder Communication & Visualisation:** Translating complex quantitative outputs into accessible insights, reports, and dashboards (Python/matplotlib, Power BI); bridging data analysis and business decisions for technical and non-technical audiences; improving analytical approaches for non-technical stakeholders

## Professional Experience

---

- **Admaren Tech.** **Cochin, India**  
*Climate Data Scientist* *Mar 2025–Jan 2026*
  - Built automated data pipelines and delivered analytics on operational ocean-weather datasets; collaborated with software engineers to integrate outputs into production systems
  - Quantified extreme event probabilities to support maritime risk decisions; produced dashboards and analytical reports translating findings into operational recommendations for clients
- **University of Bergen** **Bergen, Norway**  
*PhD Research Fellow, Climate Risk* *Jan 2021–Jan 2025*
  - Defined impact and success metrics for windstorm prediction models; designed evaluation frameworks and interpreted experimental results to measure outcome improvements; improved forecast quality by ~40% through systematic hypothesis testing and calibration against observed outcomes
  - Addressed ambiguous analysis problems by gathering domain expert input and synthesising coherent evaluation frameworks; identified and corrected flawed model assumptions to improve output reliability
  - Produced analytical reports and risk insights for insurance stakeholders; translated complex probabilistic outputs into accessible findings and recommendations, enabling non-technical decision-makers to act on model results

## Selected Projects

---

- **Wind Power Forecasting – NORA AI Hackathon (2025):** Built and benchmarked ensemble ML models (XGBoost, LightGBM, Random Forest); improved forecast accuracy by >50% via systematic feature engineering and optimisation. Ran structured model comparisons as controlled experiments with defined metrics; documented methodology, results, and evaluation framework.

## Education

---

- **University of Bergen** **Bergen, Norway**  
*PhD, Applied Statistics – Climate Risk Modeling* *Jan 2021–Jan 2025*
- **Cochin University of Science and Technology** **India**  
*M.Sc Statistics (First Class with Distinction)* *2018–2020*

## Languages & Certifications

---

- English (fluent), Norwegian (beginner)
- Introduction to Generative AI – Google Cloud (2025); Azure Fundamentals – DataCamp (2025); Machine Learning Scientist – DataCamp; Deep Learning Professional Certificate – IBM/edX
